

Very Important!!

Please take note of the following:

“Initial ignition of the appliance

1. Take all supplementary tools out of the ash pan.
2. The regulators for the primary and secondary air control must be open.
3. **At 1st ignition the door must not be closed fully. Do not turn the handle in the locked position. The curing of the paint can cause sticking to the insulation rope, so avoid pressing the rope insulation against the door in the first few hours.**
4. **The 1st ignition must be slow and still. Initially start the fire with a little paper and twigs, gradually adding two pieces of wood at a time and gradually making the temperature hotter. Do this for about 3-4 hrs.**
5. The paint will start curing and there might be some smell and even a bit of smoke coming off from it initially. This will all go away by the second fire.
6. **Avoid touching the paint in this process as the paint becomes extremely soft and any touching can cause smudge marks.**

NB!!! – The demonstration fire done by the installer using newspapers does not qualify as “Initial Ignition”
